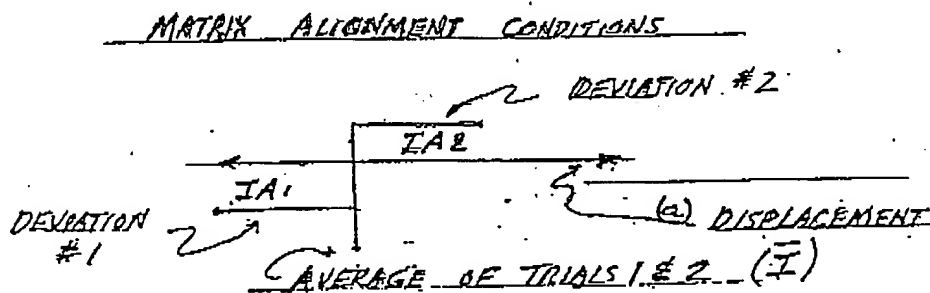

# FIGURE 8 TABLE OF INITIAL CONDITIONS & INSTRUCTIONS

## Initial Conditions - (Iteration Zero)

USE FIGURE 7 AS A TYPOLOGICAL NUMBER ARRAY, WHICH HAS BEEN PLACED IN EQUILIBRIUM BY THE COLUMNS SHIFTING FUNCTIONING OF THE DEVIATIONS SHOWN BELOW (SO AS TO MAKE IT A "CHANGE SENSOR").

NOTE THAT: AVERAGE  $I = I_{\text{signal}} + I_{\text{average noise}}$

ROW OF MINIMUM ABSOLUTE DEVIATION:  $I_{\text{signal}} = I_{\text{noise}}$  closet to  $A_v$  noise

AMOUNT OF DEVIATION =  $|IA|$  of the  $\pm$  polarity

# OF EQUIVALENT COLUMN SHIFT =  $|IA| \div \text{COLUMN SPACING}$

To start the iterative process note the entry of the signal-plus-noise in the zero column as the starting reference.

Obtain a numerical match of the entry value in the particular column in the second row which matches that in the 0 column. The column match will occur in either the right or left section.

NOTE: ENTRIES ARE ENTERED IN THE "AVERAGE ROW" COLUMN IN A SEQUENCE OPPOSITE THAT OF THE OTHER ROW

ITERATIVE PROCESS

FIG 10. ITERATIVE PROCESS

A hand-drawn block diagram on a grid background. It consists of two main rectangular blocks. The top block is labeled "DECISION LOGIC (FIG 9)". The bottom block is labeled "ITERATIVE PROCESSOR". Two curved arrows originate from the bottom block and point upwards towards the decision logic block, indicating a feedback loop. A vertical line with a horizontal bar at the top connects the two blocks, representing a data bus or communication channel.
